13. Designing and developing of the project Web page

The project's website has been designed by the UAH group with the approval of the other sub-groups. The site's main aim is to give wide dissemination to the project's results, with detailed presentation of the most important information, processes and results. It sets out the project's goals, the contents of the thematic and spatial database of the two arrears under study, a summary of the work already done, the publications to date, and other information of interest about the research teams and the Observing Promoters who take part in the Project. The objective is for users to be able to understand the relationship between the initial database, the GIS, and the procedures and techniques which will be used in the course of the Project in order to carry out its various phases. But it is also conceived as a means of communication between the two teams, which is why it includes, among other things, direct access to the project's FTP.
